

# Mysterious Ruby Backend

As a project you should create and put on Github (or Bitbucket) code written in Ruby. Subject is not important it can be everything, only below requirements must be fulfilled:

- It must be API (REST, JSON)
- It must be secured by basic auth
- It must contain User mode - with different roles (admin, user, guest)
- It must limit access to given part of API depend of User role
- Admin has access to everything
- User can read all, create all, but update and delete only his records
- Guest has only read access
- There should be at least 2 different models except User
- Those models should be in relation (1 to many)

In case of any questions feel free to ask.

**Good luck!**
